CRITICAL CARE MEDICINE

Advanced Care for the Critically Ill

24/7*	Advanced	Team-Based
Critical Care Support	**Continuous Monitoring**	**Multidisciplinary Care**
For life-threatening illness and acute organ dysfunction	Close observation and timely clinical intervention	Coordinated treatment and recovery planning

At Adhiparasakthi Hospitals, the Critical Care Medicine service provides coordinated care for patients with life-threatening illness, severe injury, or acute organ dysfunction. The service brings together critical care clinicians, nurses and multidisciplinary specialists to support rapid stabilisation, continuous assessment, organ support and recovery. Care is individualised according to clinical needs and the hospital's available facilities.

WHY CHOOSE US?

Coordinated Critical Care

01 Critical Care Expertise

Structured assessment and management for patients with complex or unstable conditions.

02 Continuous Monitoring

Close observation of vital signs and clinical status to support timely recognition of deterioration.

03 Individualised Organ Support

Respiratory, circulatory and other organ support based on clinical assessment and available resources.

04 Multidisciplinary Teamwork

Coordination with emergency medicine, anaesthesia, surgery, medicine, paediatrics and other specialties as needed.

05 Patient and Family Communication

Clear updates, shared decision-making where possible, and support for families during critical illness.

SPECIALISED CRITICAL CARE UNITS

Our Intensive Care Services

The following unit profiles describe the intended scope of each service. Unit availability, admission criteria, equipment and staffing should be confirmed against the hospital's current approved services before publication.

IMCU — Intermediate Medical Care Unit

Step-Up Monitoring & Medical Care

The IMCU provides a level of care for patients who need closer observation and more frequent clinical review than a general ward can provide, but who may not require the full support of an intensive care unit.

- Enhanced observation of vital signs and clinical status.
- Frequent reassessment for patients at risk of deterioration.
- Monitoring and treatment of selected acute medical conditions.
- Care for patients stepping down from ICU when clinically appropriate.
- Coordination with general medicine and relevant specialty teams.
- Early identification of patients who need escalation to intensive care.
- Medication review, fluid-balance monitoring and supportive care as indicated.
- Discharge or transfer planning based on clinical stability and unit criteria.

ICCU — Intensive Coronary Care Unit

Specialised Cardiac Monitoring

The ICCU provides specialised monitoring and care for patients with acute cardiac conditions who require close observation, rapid assessment and coordinated cardiology support.

- Continuous cardiac rhythm and vital-sign monitoring, where available.
- Assessment and management of acute coronary syndromes in coordination with cardiology.
- Recognition and response to significant arrhythmias.
- Monitoring of patients with acute heart failure or haemodynamic instability.
- Observation after selected cardiac interventions, according to clinical need.
- Coordination for urgent ECG, laboratory testing and cardiac imaging.
- Medication monitoring and assessment of response to treatment.
- Patient and family education regarding cardiac risk reduction and follow-up.

IRCU — Intensive Respiratory Care Unit

Advanced Respiratory Support

The IRCU focuses on patients with serious respiratory illness who need close monitoring, specialised respiratory assessment and escalation of breathing support according to clinical need.

- Monitoring of oxygen saturation, respiratory rate and work of breathing.
- Assessment and management of acute exacerbations of respiratory disease.
- Oxygen therapy and respiratory support according to unit capability.
- Non-invasive ventilation when indicated and available.
- Coordination for invasive ventilation or ICU transfer when required.
- Monitoring of patients with severe pneumonia and respiratory failure.
- Airway clearance, positioning and respiratory physiotherapy coordination when appropriate.
- Patient education and follow-up planning for chronic respiratory conditions.

SICU — Surgical Intensive Care Unit

Postoperative & Surgical Critical Care

The SICU provides close monitoring and specialised care for patients recovering from major surgery or experiencing serious surgical complications.

- Postoperative monitoring for high-risk surgical patients.
- Early recognition and management of postoperative complications.
- Support for patients with haemodynamic or respiratory instability.
- Pain assessment and analgesia review as part of the care plan.
- Monitoring of fluid balance, urine output and relevant laboratory results.
- Coordination with surgical, anaesthesia and other specialty teams.
- Care planning for infection prevention, wound review and recovery milestones.
- Transfer planning to a ward when clinical criteria are met.

TICU — Trauma Intensive Care Unit

Critical Care After Major Injury

The TICU supports patients with major injuries who require close monitoring, stabilisation and coordinated multidisciplinary trauma care.

- Initial stabilisation and ongoing monitoring after major trauma.
- Coordination with emergency medicine, trauma surgery, orthopaedics and neurosurgery as required.
- Monitoring for shock, bleeding and evolving organ dysfunction.

- Respiratory and circulatory support according to clinical need.
- Neurological observations and reassessment when indicated.
- Pain management and prevention of avoidable complications.
- Coordination of imaging, laboratory investigations and definitive treatment.
- Rehabilitation and step-down planning as the patient stabilises.

NICU — Neonatal Intensive Care Unit

Specialised Care for Newborns

The NICU provides specialised care for newborns who need close observation or advanced support because of prematurity, low birth weight, illness or complications around birth.

- Thermal care and monitoring of vital signs.
- Respiratory support for newborns according to unit capability.
- Feeding, fluid and nutritional support tailored to the newborn.
- Monitoring of glucose, jaundice and other neonatal concerns.
- Infection prevention and careful observation for signs of deterioration.
- Developmentally supportive care and support for parent–infant bonding.
- Family counselling and guidance on feeding and newborn care.
- Discharge planning, follow-up and coordination with paediatric services.

PICU — Paediatric Intensive Care Unit

Critical Care for Infants & Children

The PICU provides specialised monitoring and treatment for infants and children with serious illness, injury or acute organ dysfunction, using age-appropriate care and family-centred communication.

- Age-appropriate monitoring and assessment of critically ill children.
- Respiratory and circulatory support according to clinical need and unit capability.
- Care for severe infections, respiratory illness and acute medical emergencies.
- Postoperative monitoring for selected high-risk paediatric patients.
- Medication dosing and fluid management tailored to the child.
- Coordination with paediatrics, paediatric surgery and other specialists.
- Family updates and support during treatment.
- Recovery, rehabilitation and follow-up planning where indicated.

PACU — Post-Anaesthesia Care Unit

Safe Recovery After Anaesthesia

The PACU provides immediate postoperative observation and recovery care after anaesthesia or sedation until patients meet the criteria for transfer to an appropriate next level of care.

- Monitoring of airway patency, breathing, circulation and consciousness.
- Assessment of oxygenation, vital signs, pain and nausea or vomiting.
- Observation for residual effects of anaesthesia and early complications.
- Monitoring of temperature, bleeding and fluid status as appropriate.
- Safe handover from the operating theatre team to recovery staff.
- Prompt escalation when airway, respiratory or circulatory concerns arise.
- Use of discharge or transfer criteria according to hospital policy.
- Clear documentation and handover to the ward or critical care team.

BURNS ICU — Burns Intensive Care Unit

Specialised Care for Major Burns

The Burns ICU supports patients with major burns or complex burn injuries who require intensive monitoring, resuscitation and coordinated multidisciplinary treatment.

- Initial assessment and stabilisation of patients with major burns.
- Fluid resuscitation and monitoring according to established protocols.
- Airway and respiratory assessment, especially when inhalation injury is suspected.
- Pain management and careful monitoring of physiological status.
- Temperature control, wound-care coordination and infection-prevention measures.
- Monitoring for complications and associated injuries.
- Coordination with burns surgery, anaesthesia, nutrition and rehabilitation teams.
- Psychological support, family communication and recovery planning when appropriate.

CLINICAL SCOPE

Conditions Managed

- Acute respiratory failure and severe respiratory illness
- Sepsis and septic shock
- Shock and haemodynamic instability
- Acute cardiac conditions requiring intensive monitoring
- Major trauma and complex injuries
- High-risk postoperative conditions and surgical complications
- Serious neonatal and paediatric illnesses
- Major burns and suspected inhalation injury
- Acute neurological, metabolic and other life-threatening emergencies
- Patients requiring close observation, organ support or escalation of care

FACILITIES

Infrastructure & Clinical Support

- Critical care beds and monitoring systems, subject to unit availability
- Ventilatory and respiratory support according to available equipment
- Cardiac monitoring and resuscitation equipment as appropriate
- Infusion pumps and physiological monitoring systems
- Laboratory, blood bank and imaging support through hospital services
- Operating theatre, emergency and specialty consultation pathways
- Infection prevention, patient identification and safety protocols
- Clinical documentation, structured handover and escalation procedures

TECHNOLOGY & QUALITY

Safe, Coordinated, Evidence-Based Care

Critical care combines timely assessment, close monitoring, appropriate organ support and regular multidisciplinary review. Patient safety practices may include structured handovers, infection prevention, medication safety, pressure injury prevention, nutrition assessment, early mobilisation when appropriate, family communication and clinical audit. All services and equipment listed should reflect current hospital capability and approved protocols.

PATIENT CARE JOURNEY

Your Health. Our Commitment.

01 Stabilisation & Assessment

Rapid evaluation, initial stabilisation and identification of monitoring or organ-support needs.

02 Ongoing Critical Care

Individualised treatment, frequent reassessment and multidisciplinary review.

03 Recovery & Step-Down

Rehabilitation and transfer planning when the patient meets clinical criteria.

**Availability of specific units, beds, procedures and 24-hour services must be confirmed by the hospital before publication.*
